Marcia,

Here's a draft of the flow-rate powerpoint slide that Anne suggested. We show lower bounds for all three methods and upper bounds for two as things currently stand, then show all the same things plus 20 percent for when the riser is gone. The different colored boxes from left to right show the overlap in methods with and without the riser. We need a legend to explain it, but don't want to go any further without your guidance. Please take a look and let us know what you think.

Thanks,

Vic
