Hi all.

I got from BP some frame grabs of different shots of the plume taken at three different levels of collection up from the Top Hat. In the first image, collection up the riser was just ramping up, and only 6000 barrels was being collected. In image #2 (actually 2 frame grabs), the Enterprise was at full production of 15,000 barrels per day. So the difference between the first slide and the second slide is about 9000 barrels per day. The third slide is when the Q-4000 was being brought on line but before it reached full production, so it was at about 7000 barrels. So to my eye, anyway, I think I am seeing a much skinnier plume and a lot more of the cap exposed. The last 7000 barrels, in particular, seemed to have made a noticeable difference.

Bill and I decided that we should task BP to give us videos of the plume before and after the Q-4000 was brought on line. Anything special I should ask for from the videos in this request? Close ups? Further away? I want to make sure I get you what you want.

Marcia
